Exp No:- 7

Date:-

Aim:-
To develop a simple calculator application using the XML-RPC protocol in python that performs basic arithmetic operations like addition subtraction, multiplication and division through client server communication.

CODE:-

Server-Side code (server.py)

```
from xmlrpc.server import SimpleXMLRPCServer

class calculator:
    def add(self, x, y):
        return (x+y)
    def subtract(self, x, y)
        return x-y
    def multiply(self, x, y)
        return x*y
    def divide(self, x, y)
        if y != 0:
            return x/y
        else:
            return "Error: Division by zero is not allowed
```

Client - Side code (client.py)

```
import xmlrpc.client
Proxy = xmlrpc.client.ServerProxy("http://localhost:8000/")
print("Subtraction: 10-5=", Proxy.subtraction(10,5))
print("Addition: 10+5=", Proxy.add(10,5))
Print("Multiplication: 10*5:", Proxy.multiply(10,5))
Print("Division: 10/5:", proxy.divide(10,5))
```

Procedure:-

1. open Python IDE on Terminal
2. Create two separate Python files: Server.py & client.py
3. Observe the server & client

Op:- XML-RPC Server is running on port 8000...

Result:-

The XML-RPC client communication between server using XML-RPC.
