EXP NO:-12 Date:-

Aim:-

Learn and implement Nmap host discovery techniques to identify live hosts on a network and compare their effectiveness.

Description:-

Use Nmap probe types to discover which IPs are before port (vulnerability scans) ARP, ICMP Echo, Timestamp, Mask, TCP SYN/ACK, UDP probes, and combined with optional packet tracing or disabling ARP.

Procedure:-

-PS -PA -PU 10.10.x.0/24 nmap -sn 10.10.x.0/24 -disable-arp-ping

I/P:

Target IP or range

optional port lists for -PS -PA -PU

flags: -sn, -Pn, -PE, -PP, -PM, -PS, -PU, --packet-trace -, disable-arp-ping

O/P:-

ARP

Nmap scan report for 10.10.x.1 Host is up 10.00005 s (cabery)

MDC Address :02.B3.75.3A.F2.89

Nmap done :256 IP Addresses

Nmap scan report for 10.10.x.100 Host is up

Nmap one: 1 ip Address.

Result:-

ARP, discovery reliable, identified more the local subnet with the lowest latency and highest accuracy. while ICMP, TCP and UDP probes found hosts when ARP, ICMP were combined gave the most complete picture.
