Exp No:- 14 Date:-

Aim:

The aim of this experiment is to capture, serve & analyze network traffic on TCP/ UDP | CP| HTTP | ARP | DHCP | ILMP| CNS using wireshark tool.

Procedure:-

Step1:- Download & install wireshark from its official website. Ensure you have administrator privileges for network capture.

Step2:- Launch wireshark & identify ~~to~~ the network ~~inf~~ interface through which your device is connected to network.

Step3:- Before starting the capture, apply capture filters to focus on specific protocols reduce unwanted data.

Step4:- click the start ~~op~~ button to begin network traffic on the chosen interface.

Step5:- while capturing use display filtering to isolate & analyse specific protocols more easily.

Step6:- let the capture run until you have accumulated enough packets for analyse then click the stop button to halt the capture process.

Step7:- save the captured traffic by navigating to file save as ~~on~~ choose a suitable filename format.

Step8:- Review analyse the captured packets in details. look for key such as source observation IP Address Protocol layers, packet length, & steps

O/P:-
the op will be as list of network packets displayed in wireshark's packet detail window, which will contain.

No: Packet number in the capture sequence

Time: Timestamp when the packet was captured.

source: the source ip Address of the packet

destination: the destination, IP Address of the packet

protocal : the protocol used

length: the size of the packet integer.

Result:-

thus this experiment capture, same & analyse network specific on TCP, UDP, IP/ HTTP / AR/ DHCP / ICMF / DNS using wireshark tool.
